

Practice Questions

1. Write a Python program to calculate the area of a rectangle given its length and width.
2. Create a program that takes a user's name and age as input and prints a greeting message.
3. Write a program to check if a number is even or odd.
4. Given a list of numbers, find the maximum and minimum values.
5. Create a Python function to check if a given string is a palindrome.
6. Calculate the compound interest for a given principal amount, interest rate, and time period.
7. Write a program that converts a given number of days into years, weeks, and days.
8. Given a list of integers, find the sum of all positive numbers.
9. Create a program that takes a sentence as input and counts the number of words in it.
10. Implement a program that swaps the values of two variables.

Practice Questions

1. Given a list of numbers, find the sum and average.
2. Create a program that takes a temperature in Celsius and converts it to Kelvin.
3. Implement a program that checks if a given string is a palindrome.
4. Create a function to reverse a given string.
5. Given a list of names, concatenate them into a single string separated by spaces.
6. Write a Python program to check if a given string is a pangram (contains all letters of the alphabet).
7. Calculate the area and circumference of a circle given its radius.
8. Implement a program that converts a given number of minutes into hours and minutes.
9. Create a function to count the number of vowels in a given string.
10. Write a program to check if a number is prime.

Practice Questions

1. Create a program that takes a year as input and checks if it is a leap year or not.
2. Given a list of integers, find all the even numbers and store them in a new list.
3. Write a Python program to check if a given number is a prime number.
4. Create a program that generates the Fibonacci sequence up to a given number of terms.
5. Given a list of names, print all names starting with the letter 'A'.
6. Implement a program that prints the multiplication table of a given number.
7. Write a program that calculates the factorial of a given number.
8. Create a loop that prints all prime numbers between 1 and 50.
9. Given a list of words, count the number of words with more than five characters.
10. Calculate the sum of digits of a given number.

Practice Questions

1. Given a list of numbers, create a function to find the sum of all positive numbers.
2. Write a Python function to check if a given string is a palindrome.
3. Implement a function that returns the factorial of a given number using recursion.
4. Create a function to find the square of each element in a given list.
5. Write a function to check if a number is even or odd and return "Even" or "Odd" accordingly.
6. Calculate the area of a triangle given its base and height using a function.
7. Create a function that takes a list of strings and returns the list sorted alphabetically.
8. Write a function that takes two lists and returns their intersection (common elements).
9. Implement a function to check if a given year is a leap year or not.
10. Create a function that takes a number as input and prints its multiplication table.

Practice Questions

1. Given a list of words, concatenate them into a single string separated by spaces.
2. Create a function to reverse a given string.
3. Write a program that takes a sentence as input and counts the number of words in it.
4. Implement a function that checks if a given string is a pangram (contains all letters of the alphabet).
5. Given a string, write a function to remove all vowels from it and return the modified string.
6. Write a Python program to find the length of the longest word in a sentence.
7. Create a function that takes a sentence as input and returns the sentence in reverse order.
8. Given a list of names, count the number of names that start with a vowel.
9. Write a function to remove all duplicate characters from a given string.
10. Implement a program that takes a sentence and a word as input and checks if the word is present in the sentence.

Practice Questions

1. Given two lists of numbers, concatenate them into a single list.
2. Write a program that finds the largest and smallest elements in a list.
3. Implement a function that takes a list of numbers and returns a new list with the squared values.
4. Create a program that finds the common elements between two lists and stores them in a new list.
5. Given a list of words, find the word with the maximum length and its length.
6. Write a Python program to count the occurrences of each element in a given list.
7. Given a list of names, remove all duplicate names and print the unique names.
8. Create a function that takes a list of strings and returns the list sorted by the length of the strings.
9. Write a program that checks if a given list is sorted in ascending order.
10. Implement a function that takes two lists and returns their union (all unique elements from both lists).

Practice Questions

1. Given two dictionaries, merge them into a single dictionary.
2. Write a program that finds the most frequent element in a list.
3. Implement a function that removes a key-value pair from a dictionary.
4. Create a program that checks if two sets have any elements in common.
5. Given a list of dictionaries, find the dictionary with the highest value for a specific key.
6. Write a Python program that counts the number of occurrences of each character in a given string using a dictionary.
7. Given two sets, find the union, intersection, and difference between them.
8. Create a function that takes a list of dictionaries and sorts them based on a specified key.
9. Write a program that finds the average value of all the elements in a list of dictionaries.
10. Implement a function that takes a list of strings and returns a set of unique characters present in all strings.

Practice Questions

1. Write a Python program to copy the contents of one text file into another.
2. Given a CSV file with student names and scores, find the student with the highest score.
3. Implement a program that reads a text file and counts the number of words and lines in it.
4. Create a function that takes a list of sentences and writes them to a new text file, each on a new line.
5. Given a CSV file with employee details (name, age, salary), calculate the average salary of all employees.
6. Write a program that reads a CSV file and finds the total sales revenue for a specific product.
7. Given a text file with a list of numbers, write a function that finds the sum of all numbers in the file.
8. Implement a program that reads a CSV file and generates a bar chart to represent the data using Matplotlib.
9. Write a function that reads a JSON file and extracts specific information from it.
10. Given a CSV file with temperature data for each day of the week, find the average temperature for each day.

Practice Questions

1. Create a class to represent a Student with attributes like name, age, and grades.
2. Given a CSV file with employee details (name, position, salary), create a class to represent an Employee.
3. Implement a program that simulates a basic bank account using a BankAccount class.
4. Write a Python program that uses a Rectangle class to calculate the area and perimeter of a rectangle.
5. Create a class to represent a Car with attributes like make, model, and year.
6. Given a JSON file with customer data, create a Customer class to store and manipulate the data.
7. Write a program that uses a Person class to keep track of a person's name, age, and address.
8. Implement a program that uses a Circle class to calculate the area and circumference of multiple circles.
9. Given a CSV file with product details (name, price, quantity), create a Product class to manage the data.
10. Create a class to represent a Movie with attributes like title, director, and rating.

Practice Questions

1. Create a base class Shape with methods to calculate area and perimeter, and derive classes Circle and Square.
2. Implement a class hierarchy to represent different types of employees (Manager, Engineer) with their attributes.
3. Write a Python program that uses inheritance to represent a hierarchy of shapes (Triangle, Rectangle, etc.).
4. Create a class hierarchy to represent different types of animals (Bird, Fish) with their own attributes and methods.
5. Given a JSON file with product details (name, price, quantity), create a Product class with encapsulated attributes.
6. Implement a program that uses inheritance to represent a hierarchy of vehicles (Car, Bike, Truck, etc.).
7. Write a Python program that uses encapsulation to protect sensitive information in a User class.

Practice Questions

8. Create a class hierarchy to represent different types of electronics (Phone, Laptop) with their attributes.
9. Given a CSV file with employee details (name, position, salary), create an Employee class with private attributes.
10. Implement a program that uses inheritance to represent a hierarchy of shapes (Circle, Triangle, Rectangle, etc.).
